## Pinout description

## Best wiring solution

Do not connect together SPDIF GND with other grounds. The signal is 75 OHM terminated and isolated with a transformer. Shorting grounds together will decrease overall performance. Use isolated RCA connectors (isolated outer shield from chassis) for all signals. Connect the central ground to the enclosure. For best performance use a simple 9V battery, it should last  $\pm 8$  hours. You can use standard power 9VDC supplies as well.
