

ZVOK

OrbitDAC

At ZVOK, part of Renovo Media, we really tried to avoid the usual multi button christmas tree device, instead academic knowledge and budget constrains were driving the design to outcome with an instrument made of selected components having an affordable price.

These digital to analog converters (DAC) come in three models (A, B and C). They all have a coaxial input working up to a rate 24bit 192KHz and an optical input working up to a rate 24bit 96KHz. The device is powered by a 9V DC source, either from battery or wall power supply transformer and has an ultra low power consumption.

The A model is meant for home use and has a fixed RCA stereo output. Models B and C include also **differential outputs**. Every output is powerful enough to drive studio monitor loudspeakers, preamps or final amplifiers. It can couple easily with solid state or tube based equipment. The C model however, has also a **top quality analog volume control knob**.

This is a DAC that indeed lifts up even the oldest CD players on the market. Suitable also for Blue ray players, DVD, Computers, music streamers etc.

Have a glass of your favorite drink and enjoy a nice evening in your listening space in couple or with friends. Drown yourself into music!

Distributor for OrbitDAC converters:
